

BuildX'26 — Best Use of Stellar Blockchain Track

Track Overview

The Stellar Track recognizes projects that meaningfully integrate Stellar blockchain technology into their solution using Soroban Smart Contracts.

To be eligible for judging and prizes, teams must build and deploy a functional blockchain-powered application using Stellar.

 Important: Merely mentioning Stellar or creating a blockchain-related idea is not sufficient. Your project must include a working Stellar implementation.

Mandatory Requirements

Every submission for the Stellar Track must include ALL of the following:

1. Soroban Smart Contract

Your project must implement at least one Soroban Smart Contract.

Examples:

- Payment logic
- Reward systems
- Escrow contracts
- Tokenized assets
- Loyalty programs
- Verification systems
- Marketplace logic
- DAO governance logic

Soroban is Stellar's smart contract platform built for creating decentralized applications and blockchain-powered products.

2. Frontend Integration

The smart contract must be connected to a working frontend application.

Examples:

- React
- Next.js
- Vue
- Flutter
- React Native

Users should be able to interact with the blockchain functionality through the application interface.

Examples:

- Create transactions
 - Trigger smart contract functions
 - View blockchain data
 - Execute contract actions
-

3. Public GitHub Repository

Your project must be publicly available on GitHub.

The repository should contain:

- Source code
- Smart contract code
- Frontend code
- Deployment details
- Setup instructions

Private repositories will not be considered for evaluation.

4. Testnet Deployment (Mandatory)

Your Soroban Smart Contract **MUST** be deployed to the Stellar Testnet.

Projects without testnet deployment will not be considered complete.

Judges must be able to verify:

- Contract deployment
- Contract functionality
- On-chain execution

Deployment and testing on Stellar Testnet is a mandatory requirement for this track.

5. Comprehensive README

Every repository must include a detailed README.

The README should include:

Project Overview

- Problem statement
- Solution description
- Key features

Technology Stack

- Frontend
- Backend
- Smart Contract Technologies

Smart Contract Information

- Contract purpose
- Contract architecture
- Contract addresses
- Testnet deployment details

Setup Instructions

- Installation steps
- Running locally
- Environment variables

Demo Information

- Screenshots
- Demo video
- Live deployment links (if available)

Team Information

- Team name
- Team members
- Contact details

Projects with incomplete documentation may lose evaluation points.

Recommended Development Workflow

Step 1

Build your frontend application.

Step 2

Create and test your Soroban Smart Contract.

Step 3

Connect the frontend with the deployed contract.

Step 4

Deploy the contract on Stellar Testnet.

Step 5

Publish the GitHub repository.

Step 6

Document everything clearly in the README.

Step 7

Submit the project through Builderbase.

Suggested Project Categories

Teams can build:

FinTech

- Payment applications
- Expense management

- Remittance platforms
- Escrow systems

Education

- Credential verification
- Student rewards
- Academic certificates

Communities

- Loyalty programs
- Contribution rewards
- Membership systems

Sustainability

- Carbon credits
- Recycling rewards
- Impact tracking

Web3

- DAOs
- Tokenized assets
- Digital ownership systems

Judging Criteria

Projects will be evaluated on:

- Innovation
- Technical Implementation
- Product Quality
- User Experience
- Real-World Impact
- Effective Use of Stellar
- Smart Contract Design
- Testnet Deployment
- Documentation Quality

Final Note

The strongest submissions are not necessarily the most complex.

Focus on solving a real-world problem and use Stellar where blockchain genuinely adds value.

Remember:

- ✓ Smart Contract Required
- ✓ Frontend Integration Required
- ✓ Public GitHub Required
- ✓ Testnet Deployment Required
- ✓ Detailed README Required

Failure to satisfy any of these requirements may result in disqualification from the Stellar Track.

Good luck and happy building!

— Team BuildX
